

ABSTRACT OF THE DISCLOSURE

5 A marine vessel trolling and battery recharging system includes an electric
generator/trolling device having a propeller. The device is electrically coupled to a
battery and extendable downwardly from the marine vessel into the water. When
electric power is supplied to the generator/trolling device in a first orientation, the
propeller turns and serves as a trolling motor. However, when the generator/trolling
device is positioned in a second orientation and the main engine of the marine
vessel is powered, the propeller spins freely and serves to recharge the battery of
10 the marine vessel.
